Let's Start!

More Direct Communication and Fewer Written Reports

Learning Outcome:

Describe ways of solving problems and getting things done in written and spoken situations and in work and social contexts.

Train the system users on application structuring and management, according to the established plan and user profile, according to the organization policies.

Ask your partner:

- Have you ever had any problems with defect tracking processes? What were they?
- When do you think defect tracking can be counterproductive?

Can Do Statements:

- I can explain what a bug or defect tracking system is.
- I can explain what a bug or defect tracking system is.
- I can talk about why defect tracking metrics can become detrimental.

Let's Explore!

We should not be misguided* by the results

* We use the word '*misguided*' to refer to something or someone that is wrong about something.

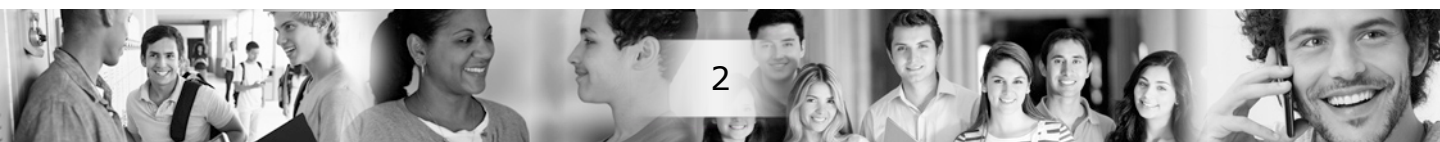

Instructions: Read the text below.

We've been assessing the software development processes of a company that's having issues with tracking and fixing defects.

So far, we could say that their advanced bug tracking system allows them to enter detailed data about the detected bugs. Nevertheless, they must have wasted a lot of time entering the information about these defects since this process can be time-demanding. Let's not forget that bug tracking systems help the team collect and track data in a database for simplifying the tracking and the fixing processes. However, they may have misunderstood the real function of this system, which is to facilitate work and not to demand the team to enter every possible piece of information about all the bugs they find. They might not have realized that tracking bugs that aren't going to get fixed is harmful for the process, since this is a waste of time for the team.

The company might have disregarded the advantages of direct communication, in which both developers and testers can discuss face to face and clear up any misunderstandings; whereas, defect tracking can sometimes mislead to a wrong interpretation of one another's words. I felt tension between some of the members, and this may have been due to the fact that a report is a poor means of communication and both parties can feel their work is being underestimated by the other.

Unfortunately they didn't grasp these problems before. They must have taken the issues regarding defect metrics for granted. Furthermore, defect metrics can be detrimental if they are used for measuring the tester's productivity. As not everyone knows how to properly write a bug report, some users prefer not to report certain bugs. Therefore, their metrics could have indicated a lower amount of defects, and they must have wrongly inferred that the product's quality was improving.

Let's Practice!

Defining a Bug or Tracking Defects System

Instructions: Read the paragraph. Underline all the mistakes in the paragraph.

They must has had several problems with the bug tracking system as they did not take the time to analyze its functions and purposes.

Let's not forget that bug tracking systems help the team collect and track data in a database for simplifying the tracking and fixing processes. However, trainers may don't have told the employees to enter only the useful data. They can have been much more efficient if they had realized that tracking bugs that aren't going to get fixed is harmful for the process, since this is a waste of time for the team. Furthermore, they could have agree upon specific requirements for a defect to be entered to the system or disregarded. As a personal advice, talk with your employees, they most have been very upset when working on such a time-consuming task. Explain how the bug tracking system works.

Let's Practice!

Metrics can be detrimental.

Instructions: Select the correct option to complete the sentence.

Read the sentences aloud.

1. They may _____ communication in different ways.
a. have affected b. have be affected c. have being affected d. has affected
2. Those metrics must _____ the issues in measuring.
a. have considered in b. has considered c. have considered
d. has being considered
3. Defect metrics _____ in measuring efficient development of systems.
a. can have be applying b. applied in c. could have been applied
d. can have been applied
4. The companies may _____ advantage of those communication ways.
a. have taken b. have being taken c. has taken d. has being taken
5. The systems may _____ detrimental for companies.
a. have been b. have being c. has been d. has been be
6. They _____ misunderstood the real function of this system which is to facilitate work
a. may has b. may have c. must having d. should to have

Extension Activity

Explaining tracking defects system.

Instructions: Complete the following steps. Fill in the Self-Assessment.

- Read about tracking defects systems.
- Describe how they work.
- Write a brochure describing how they work and provide clear examples.
- Show your brochure to your classmates and teacher.

Self-Assessment

Yes

No

- I read about tracking defects system.
- I describe how the work.
- I write a brochure.
- I show my brochure to my classmates and teacher.

☐	☐
☐	☐
☐	☐
☐	☐

Target Words

- **underestimated** (adjective): something that is not estimated for the value it deserves.
e.g. I felt tension between some of the members, and this may have been due to the fact that a report is a poor means of communication and both parties can feel their work is being underestimated by the other.
- **whereas** (connector): on the contrary, while.
e.g. The company might have disregarded the advantages of direct communication, in which both developers and testers can discuss face to face and clear up any misunderstandings; whereas, defect tracking can sometimes mislead to a wrong interpretation of one another's words.
- **mislead** (verb): to lead towards a wrong direction or conclusion.
e.g. Defect tracking can sometimes mislead to a wrong interpretation of one another's words.

- **detrimental** (adjective): something that is harmful.
e.g. Defect metrics can be detrimental if they are used for measuring the tester's productivity.

- **due to the fact that** (expression): as a consequence of, for this reason.
e.g. I felt tension between some of the members, and this may have been due to the fact that a report is a poor means of communication and both parties can feel their work is being underestimated by the other.

- **disregard** (verb): to neglect or pay no attention to something.
e.g. The company might have disregarded the advantages of direct communication, in which both developers and testers can discuss face to face and clear up any misunderstandings.

Learning Points

Must Have, May Have, Might Have, and Could Have for Speculating About the Past

We use **modal verbs for speculating about the past** when we want to explain or draw conclusions about an event in the past.

When we are not sure about how a past event took place, we can speculate by using modal verbs. The basic structure for this, is the following:

Subject + **modal verb** + **have** + **past participle of main verb** + complement

Example:

*The defect fixing process **could have been** much more effective.*

We can also use these **modal verbs** in the negative form. The structure for this would be the following:

Subject + **modal verb** + **not** + **have** + **past participle of main verb** + complement

Example:

*The defect fixing process **should not have been** so tedious.*

There are different modal verbs we can use for providing more information about how certain we are about the past event. Let's take a look at the following chart:

Level of certainty	Did happen	Example	Did not happen	Example
Very certain	Must have	<i>We must have tracked defects.</i>	Must not have	<i>We must not have tracked defects.</i>
			Could not have	<i>We could not have tracked defects.</i>
Kind of certain	Could have	<i>We could have tracked less defects.</i>	May not have	<i>We may not have solved the defects.</i>
			Might not have	<i>We might not have solved the defects.</i>
Not very certain	May have	<i>We may have solved the defects.</i>		
	Might have	<i>We might have solved the defects.</i>		

Notice that in the negative form, the modal verb '**could**' has a high level of certainty and the modal verbs '**may**' and '**might**' can express a middle or a low level of certainty in the negative form.

Learning Points

Examples

- *They must have wasted a lot of time entering the information about these defects since this process can be time-demanding.*
- *They may have misunderstood the real function of this system, which is to facilitate work and not to demand the team to enter every possible piece of information about all the bugs they find.*
- *They might not have realized that tracking bugs that aren't going to get fixed is harmful for the process, since this is a waste of time for the team.*
- *The company might have disregarded the advantages of direct communication, in which both developers and testers can discuss face to face and clear up any misunderstandings.*

Bug/Defect Tracking Systems

A bug tracking system, also known as a defect tracking system, is a software application whose function is to keep track of bugs in software development projects.

A bug tracking system is usually a very important part of a good software development project as it allows the team to evaluate defects and make sure they do not pass unnoticed.

The bug tracking system uses a database that records the important facts about the known bugs. These facts can include the time at which the bug was reported, how severe it is, why it is a defect, and who is in charge of fixing it. By using this system, the team will have clear information and an overview of the defects found in the development process of a product.
